

## What is PHRAnywhere and Why Should I Participate?

PHRAnywhere is changing the way healthcare is perceived and delivered. PHRAnywhere is a database that stores very important information, such as participating members' health history including family health status, allergies, recent prescriptions and insurance benefits. Participating members can access or contribute information to their medical history through the web-site, and they can share this information with *their* physicians.

The PHRAnywhere card is the “key” to providing physicians access to the information. By accessing a member's records through one central database, physicians now have access to information needed to provide immediate care with a better understanding of their patient's medical history. For example, PHRAnywhere stores all prescriptions (including names of medications and dosages) filled and paid for under the member's participating insurance plan.

PHRAnywhere allows instant access to participating members' healthcare information. Current features of the program include access to the following:

- Member demographics (address, DOB, etc.)
- Eligibility information and verification of benefits
- Health benefit plan (co-pay, deductible, out-of-pocket, etc.)
- Preferred drug list (formulary and co-pay tiers)
- Personal health information and history
- Labs, medications and office visit history
- Documents, such as Living Wills, Do Not Resuscitate orders, HIPAA releases and Certificates of Credible Coverage
- Integration with disease management programs

PHRAnywhere enhances healthcare through cost effective delivery of complete information and allows physicians to focus on quality of care.
